INVOICE

Update Procedure

Keywords in the message text — updating an existing installation

This update lets Invoice look for your keywords in the message text of the emails, in addition to the subject and the attachment names. It is for an installation that already works in C:\DEV\Factures. Your settings, sign-in, register and invoice files are kept. Allow 10 minutes.

Version 0.1.0 · 08 November 2026

Contents

1. What changes 3

2. Close Invoice 4

3. Back up your files 4

4. Install the new files 4

5. Check 5

6. If something goes wrong 6

1. What changes

- New setting `search_in`: where keywords are looked for — `"subject"`, `"filename"` (attachment names) and/or `"body"` (message text). **Default: all three.**
- Every email Gmail returns is now re-checked on your computer, so an email is only imported when a keyword really is in one of those places (not, for instance, only in the sender's address). Such emails are shown with ~ and skipped.
- Keyword matching ignores accents as well as case (`Facture` also finds “facturé”).
- `invoices query` shows where keywords are searched; `invoices fetch` accepts `--search-in subject,filename` for a single run.

> **Important.** Searching the message text finds more emails. On the first run after the update, emails from the last year (setting newer_than) that mention a keyword only in their text will be imported too. Do the dry run in step 5 first and look at the list.

Files in this update

File	Change
`src/invoice_manager/matching.py`	**New.** Checks where each keyword appears in an email.
`src/invoice_manager/config.py`	New setting search_in; Gmail search built from it.
`src/invoice_manager/fetcher.py`	Re-checks each email; skips those without a keyword (~).
`src/invoice_manager/cli.py`	query shows “Searched in”; fetch --search-in; summary line.
`src/invoice_manager/gmail.py`	Paces Gmail requests; waits and retries on “Quota exceeded”, then stops cleanly.
`config.example.toml`	Documents search_in.
`README.md`	Documents search_in.
`docs/*.pdf, docs/build_docs.py`	Install Guide and User Manual updated; this document.
`tests/test_matching.py, tests/test_rate_limit.py`	**New.** Tests (not needed to use Invoice).
`tests/test_config.py, tests/test_fetch.py`	Tests updated.

Your own files are **not** part of the update and must not be replaced:

Keep as is	What it is
`config.toml`	Your settings (account, keywords, invoices folder).
`credentials.json`	Your Google app identity.
`token.json`	Your Gmail sign-in.
`data\`	Your register invoices.db (list, statuses, notes).
`.venv\`	The Python environment.
Your invoices folder	Set by invoices_dir; never touched by an update.

> **Tip.** No new Python package is needed, and nothing changes in the register: the update only replaces program files.

2. Close Invoice

Close any window where Invoice is running (the Factures desktop launcher, or a PowerShell window with `(.venv)` at the start of the line).

Then open a new **PowerShell** window (Start menu › type “PowerShell”).

3. Back up your files

Copy your personal files to a dated backup folder. Paste these lines into PowerShell:

```
$App = "C:\DEV\Factures"
$Backup = "C:\DEV\Factures-backup-$(Get-Date -Format yyyy-MM-dd)"
New-Item -ItemType Directory -Force $Backup | Out-Null
foreach ($f in "config.toml", "credentials.json", "token.json", "data") {
    if (Test-Path "$App\$f") { Copy-Item "$App\$f" $Backup -Recurse -Force }
}
Get-ChildItem $Backup
```

The last line lists what was saved: you should see config.toml, credentials.json, token.json and data.

4. Install the new files

Use **A** if your C:\DEV\Factures folder was created with *git clone*, **B** if you downloaded a ZIP. If unsure, run `git -C C:\DEV\Factures status`: an error such as “not a git repository” means ZIP.

A. With git

```
cd C:\DEV\Factures
git fetch origin claude/inspiring-tesla-7jpw97
git checkout claude/inspiring-tesla-7jpw97
git pull origin claude/inspiring-tesla-7jpw97
```

Your personal files are ignored by git and stay in place. If git refuses with “Your local changes would be overwritten”, a program file was edited by hand: note its name, and either restore it with `git checkout -- FILE` or use method B.

B. With a ZIP download

1. Open the project page on GitHub, choose the branch **claude/inspiring-tesla-7jpw97** in the branch selector, then **Code › Download ZIP**.
2. Extract the ZIP into your Downloads folder. This gives the folder **invoice-claude-inspiring-tesla-7jpw97**.

3. Copy the program files over your installation (personal files are not in the ZIP, so they cannot be overwritten):

```
$New = "$env:USERPROFILE\Downloads\invoice-claude-inspiring-tesla-7jpw97"
$App = "C:\DEV\Factures"
foreach ($d in "src", "tests", "docs", "scripts") {
    Copy-Item "$New\$d" $App -Recurse -Force
}
foreach ($f in "pyproject.toml", "README.md", "config.example.toml",
              ".gitignore", ".gitattributes") {
    Copy-Item "$New\$f" $App -Force
}
```

> **Tip.** If the extracted folder has another name or place, change the first line. If Windows put the files one level deeper (Downloads\invoice-claude-inspiring-tesla-7jpw97\invoice-claude-inspiring-tesla-7jpw97), add that second level to the path.

Refresh the installation

Not strictly needed for this update, but quick and safe:

```
cd C:\DEV\Factures
.\.venv\Scripts\Activate.ps1
pip install -e .
```

5. Check

```
invoices query
```

A new line **Searched in** must appear:

```
Account: your.name@gmail.com
Invoices folder: C:\...\Factures
Keywords: Facture, Facturation, Invoice
Searched in: subject, attachment names, message text
Gmail query: has:attachment {Facture Facturation Invoice filename:Facture
    filename:Facturation filename:Invoice} -label:invoices-processed newer_than:1y
```

Then preview what the next import would add — nothing is saved:

```
invoices fetch --dry-run
```

Lines with `+` would be imported; lines with `~` were found by Gmail but have no keyword where Invoice looks, and are skipped.

Choose where to search (optional)

Nothing to change in config.toml if you want all three places: that is the default. If the dry run brings too many emails that only mention an invoice, add this line to `config.toml` (under keywords) to go back to subject and attachment names only:

```
search_in = ["subject", "filename"]
```

When the dry run looks right, import as usual: `invoices fetch`, or double-click the Factures launcher on your desktop.

6. If something goes wrong

Symptom	What to do
`invoices query` has no “Searched in” line	The new files were not copied where Invoice runs from. Check the paths in step 4 and that you are in C:\DEV\Factures.
“Quota exceeded … Units per minute per user”	Gmail's per-minute limit: Invoice waits and retries, then stops. Run `invoices fetch` again a few minutes later; it continues where it stopped.
`search_in` … unknown value	A typo in config.toml: allowed values are "subject", "filename", "body".
Too many non-invoice emails imported	Mark them with `invoices ignore ID`; restrict search_in (step 5) or exclude senders with `extra_query`.
Anything else	Go back to the previous version below and send me the message.

Going back to the previous version

1. Restore the program: with git, `git checkout 9457a86`; with a ZIP, copy the folders from your previous download as in step 4B.
2. Restore your personal files if needed: copy them from the backup folder of step 3 back into C:\DEV\Factures.

Emails already imported stay in the register; going back only changes how the next imports search.
